I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

Notes

- a) If you need help to fill in this form or you have any questions, please contact the Patent Office on 0645 500505.
- b) Write your answers in capital letters using black ink or you may type them.
- c) If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- d) If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- e) Once you have filled in the form you must remember to sign and date it.
- f) For details of the fee and ways to pay please contact the Patent Office.

METHOD AND COMPOSITION FOR THE PREPARATION OF A PRINTING PLATE

FIELD OF THE INVENTION

5 This invention relates to a method and composition for the preparation of a printing plate and to a printing plate prepared by the method.

BACKGROUND OF THE INVENTION

10 Printing plates suitable for offset lithographic printing are known which comprise a support having non-image areas which are hydrophilic and image areas which are hydrophobic and ink-receptive.

 The art of lithographic printing is based upon the immiscibility of oil and water, wherein the oily material or ink is preferentially retained by the image area and water or fount (or fountain) solution is preferentially retained by
15 the non-image area. When a suitably prepared surface is moistened with water and an ink is then applied the background or non-image area retains the water and repels the ink while the image area accepts the ink and repels the water. The ink on the image area is then transferred to the surface of a material upon which the image is to be reproduced, such as paper or cloth.

20 Commonly the ink is transferred to an intermediate material called the blanket, which in turn transfers the ink to the surface of the material upon which the image is to be reproduced.

 Inkjetting is a non-impact method for producing images by the deposition of ink droplets on a substrate in response to digital signals.

25 JP-A-53015905 describes the preparation of a printing plate by inkjetting an alcohol-soluble resin in an organic solvent onto an aluminum printing plate.

 JP-A-56105960 describes the formation of a printing plate by inkjetting onto a support e.g. an anodized aluminum plate an ink capable of
30 forming an oleophilic image and containing a hardening substance such as epoxy-soybean oil together with benzoyl peroxide or a photo-hardening substance such as an unsaturated polyester.

EP-A-0 882 584 describes a method of preparing a printing plate comprising producing an oleophilic image on the surface of a support by inkjet printing the image on the surface using an aqueous solution of a salt of a hydrophobic organic acid e.g. oleic acid.

US Patent No. 6131514 describes a method of preparing a printing plate comprising producing an oleophilic image on the surface of a support by inkjet printing the image on the surface using an aqueous solution or aqueous colloidal dispersion of a polymer bearing water-solubilising groups wherein the water solubilising groups interact with the surface of the support thereby binding the polymer to the support and rendering the polymer insoluble.

WO 0037261 describes a method for the preparation of a lithographic printing plate which comprises forming an oleophilic image on the surface of a hydrophilic support by depositing by inkjetting the image on the surface using an aqueous dispersion of an oligomer having in the molecule both hydrophilic and hydrophobic groups.

WO 0037254 describes a method for the preparation of a lithographic printing plate which comprises forming an oleophilic image on the surface of a hydrophilic support by depositing by inkjetting the image on the surface using an aqueous emulsion of an organic film-forming polymer which has been prepared by emulsion polymerisation, whereby the polymer adheres to the surface of the printing plate forming an oleophilic film.

US Patent No. 6025022 discloses an inkjet printing system consisting of at least two reactive components i.e. an aziridine and a polymer having attached at least one functional group that is reactive with an aziridine. A method of preparing a printing plate is described wherein (1) a glass plate is coated with a composition comprising a colorant, a carboxylic acid-functionalized polymer, a catalyst and a carrier medium, and (2) an image is printed on the coated plate with a composition comprising an aziridine and a carrier medium. In contrast, the present invention uses a single coating composition or writing fluid in producing the required image. In particular, the method and composition of the invention do not make use of an aziridine and/or a catalyst.

PROBLEM TO BE SOLVED

The methods of the prior art which use aqueous writing fluids provide simple, rapid and comparatively low cost ways of forming lithographic printing plates and doing lithographic printing. The number of prints or impressions given by a printing plate is an important feature of its performance, and the method of the invention can unexpectedly improve the number of impressions given by printing plates formed by inkjetting aqueous solutions or dispersions of negatively charged polymers onto a hydrophilic substrate.

SUMMARY OF THE INVENTION

The invention provides a method for the preparation of a printing plate comprising ink-jet printing an oleophilic image on a surface of a support by applying to the support an aqueous solution or aqueous colloidal dispersion of a polymer having water-solubilising groups wherein the water-solubilising groups interact with the surface of the support thereby binding the polymer to the support and rendering the polymer insoluble, characterised in that the aqueous solution or aqueous colloidal dispersion of polymer comprises pigment particles dispersed therein.

The invention also provides a composition suitable for the preparation of a printing plate by inkjet printing comprising an aqueous solution or aqueous colloidal dispersion of a polymer having water-solubilising groups, characterised in that said aqueous solution or aqueous colloidal dispersion further comprises pigment particles dispersed therein.

DETAILED DESCRIPTION OF THE INVENTION

The image on the surface of the printing plate is produced using an aqueous solution or aqueous colloidal dispersion of a polymer having water-solubilising groups. The image written to the printing plate becomes hydrophobic and ink-receptive to give a plate suitable for offset lithographic printing.

Preferably, the polymer comprises a substantially non-polar or hydrophobic backbone chain bearing pendant groups which contain water-

solubilising groups.

The water-solubilising groups and the support are chosen so that the water-solubilising groups interact with the surface of the support thereby binding the polymer to the support. Various forms of interaction are possible including chemical or physical interactions such as ionic interactions, covalent bonding, hydrogen bonding and the formation of coordination complexes. By interaction with the surface of the support the groups lose their ability to confer water-solubility on the polymer and the polymer is rendered insoluble.

Suitable water-solubilising groups include ionisable acid groups e.g. carboxylic acid groups and sulphonic acid groups. The groups may be ionised so that the polymer is in the form of a salt. The salt may be an alkali metal or ammonium salt. The alkali metal may be sodium or potassium and the ammonium ion may be quaternised for example a tetraalkyl ammonium ion such as tetramethyl or tetrabutyl ammonium.

The proportion of water-solubilising groups must be sufficient to confer water solubility or water-dispersibility on the polymer, but low enough that the polymer when adsorbed on the printing plate gives an oleophilic surface. The proportion of free water-solubilising groups may be varied through the proportions of monomers used to form the polymer, or by derivatising a fraction of the water-solubilising groups present in the polymer. For example, the proportion of free carboxylic acid groups may be varied by esterification.

The hydrophobic backbone may be essentially a hydrocarbon chain, as in polymers or copolymers prepared by the polymerisation of ethylenically unsaturated monomers. Examples of suitable monomers include ethylene, propylene, styrene, vinyl ethers, acrylamide, methacrylamide, acrylic acid, methacrylic acid, maleic acid, maleic anhydride and 2-acrylamido-2-methylpropanesulphonic acid. Alternatively, the hydrophobic backbone could be another type of chain such as a polyester chain.

Suitable polymers include copolymers of ethylene and acrylic acid, and copolymers of styrene with acrylic or maleic acids.

Other suitable polymers, including short chain polymers known as oligomers, are described in WO 0037254 and WO 0037261.

Particularly preferred polymers are the sulphonated polyesters e.g. sulphonated polyester AQ 55 S supplied by Eastman Chemical Corporation, and styrene-acrylate copolymers e.g. Jonrez IJ4655, supplied by Westvaco Corporation.

The concentration of polymer in the solution used in the ink jet printer may be in the range 0.02 to 8% by weight, with a preferred range of 0.2 to 3.0% by weight.

It is necessary that the polymer is in the form of an aqueous solution or a stable colloidal dispersion, so that it can pass through the jets of the printer head.

The writing fluid used in the invention also contains a dispersed pigment which is in the form of a stable suspension in the aqueous medium. The particle size must be small enough so that it can pass through the jets of the printer head. Particle sizes in the range 10 to 100 nm are preferred, and especially in the range 20 to 50 nm.

A wide variety of organic and inorganic pigments, alone or in combination, may be selected for use in the present invention. Colorant particles which may be used in the invention include pigments as disclosed, for example in U.S. Patents 5,026,427; 5,086,698; 5,141,556; 5,160,370; and 5,169,436. The exact choice of pigments will depend upon the specific application and performance requirements such as color reproduction and image stability. Pigments suitable for use in the present invention include, for example, azo pigments, monoazo pigments, disazo pigments, azo pigment lakes, β -Naphthol pigments, Naphthol AS pigments, benzimidazolone pigments, disazo condensation pigments, metal complex pigments, isoindolinone and isoindoline pigments, polycyclic pigments, phthalocyanine pigments, quinacridone pigments, perylene and perinone pigments, thioindigo pigments, anthrapyrimidone pigments, flavanthrone pigments, anthanthrone pigments, dioxazine pigments, triarylcarbonium pigments, quinophthalone pigments, diketopyrrolo pyrrole pigments, titanium oxide, iron oxide, and carbon black. Typical examples of pigments which may be used include Color Index (C. I.) Pigment Yellow 1, 2, 3,

5, 6, 10, 12, 13, 14, 16, 17, 62, 65, 73, 74, 75, 81, 83, 87, 90, 93, 94, 95, 97, 98,

48:4, 49:1, 49:2, 49:3, 50:1, 51, 52:1, 52:2, 53:1, 57:1, 60:1, 63:1, 66, 67, 68, 81,
10 95, 112, 114, 119, 122, 136, 144, 146, 147, 148, 149, 150, 151, 164, 166, 168,
169, 170, 171, 172, 175, 176, 177, 178, 179, 181, 184, 185, 187, 188, 190, 192,
194, 200, 202, 204, 206, 207, 210, 211, 212, 213, 214, 216, 220, 222, 237, 238,
239, 240, 242, 243, 245, 247, 248, 251, 252, 253, 254, 255, 256, 258, 261, 264;
C.I. Pigment Violet 1, 2, 3, 5:1, 13, 19, 23, 25, 27, 29, 31, 32, 37, 39, 42, 44, 50;
15 C.I. Pigment Blue 1, 2, 9, 10, 14, 15:1, 15:2, 15:3, 15:4, 15:6, 15, 16, 18, 19, 24:1,
25, 56, 60, 61, 62, 63, 64, 66; C.I. Pigment Green 1, 2, 4, 7, 8, 10, 36, 45; C.I.
Pigment Black 1, 7, 20, 31, 32, and C.I. Pigment Brown 1, 5, 22, 23, 25, 38, 41,
42.

In a preferred embodiment of the invention, the pigment is C.I.
20 Pigment Blue 15:3, C.I. Pigment Red 122, C.I. Pigment Yellow 155, C.I. Pigment
Yellow 74, C.I. Pigment Black 7 or bis(phthalocyanylaluminum)tetraphenyl-
disiloxane as described in U.S. Patent No. 4,311,775. In an especially preferred
embodiment of the invention, the pigment is Pigment Yellow 155.

The pigment may be present in the writing fluid used in the
25 invention in any effective amount, generally from 0.1 to 10% by weight, and
preferably from about 0.5% to about 6% by weight.

While water is the preferred aqueous carrier medium, the aqueous
composition may comprise one or more water miscible solvents e.g. a polyhydric
alcohol such as ethylene glycol, diethylene glycol, triethylene glycol or
30 trimethylol propane. The amount of aqueous carrier medium in the aqueous
composition may be in the range from 30 to 99.995, preferably from 50 to 95% by
weight.

Jet velocity, separation length of the droplets, drop size and stream stability are greatly affected by the surface tension and the viscosity of the aqueous composition. Inkjet writing fluids suitable for use with inkjet printing systems may have a surface tension in the range from 20 to 60, preferably from 30 to 50 dynes/cm. Control of surface tensions in aqueous writing fluids may be accomplished by additions of small amounts of surfactants. The level of surfactants to be used can be determined through simple trial and error experiments. Anionic and nonionic surfactants may be selected from those disclosed in U.S. Patent Nos. 5,324, 349; 4,156,616 and 5,279,654 as well as many other surfactants known in the inkjet art. Commercial surfactants include the SURFYNOLTM range from Air Products; the ZONYLTM range from DuPont; the FLUORADTM range from 3M and the AEROSOLTM range from Cyanamid.

The viscosity of the writing fluid is preferably no greater than 20 centipoise e.g. from 1 to 10, preferably from 1 to 5 centipoise at room temperature.

The solution used in the ink jet printer may comprise other ingredients, for instance water-soluble liquids or solids with a substantially higher boiling point than water, e.g. ethanediol, diethylene glycol, triethylene glycol, or other humectants to help prevent the ink from drying out or crusting in the orifices of the print head. A biocide such as PROXELTM GXL from Zeneca Colours may be added to prevent unwanted microbial growth which may occur in the ink over time. Additional additives which may be optionally present in the ink include thickeners, pH adjusters, buffers, conductivity enhancing agents, anti-kogation agents, drying agents and defoamers.

The aqueous composition is employed in inkjet printing wherein drops of the composition are applied in a controlled fashion to the surface of the support by ejecting droplets from a plurality of nozzles or orifices in a print head of an inkjet printer.

Commercially available inkjet printers use several different schemes to control the deposition of the ink droplets. Such schemes are generally of two types: continuous stream and drop-on-demand.

In drop-on-demand systems, a droplet of ink is ejected from an orifice directly to a position on the ink receptive layer by pressure created by, for example, a piezoelectric device, an acoustic device, or a thermal process . . .
5 controlled in accordance with digital signals. An ink droplet is not generated and ejected through the orifices of the print head unless it is needed. Inkjet printing methods and related printers are commercially available and need not be described in detail.

The aqueous composition may have properties compatible with a
10 wide range of ejecting conditions, e.g. driving voltages and pulse widths for thermal inkjet printers, driving frequencies of the piezoelectric element for either a drop-on-demand device or a continuous device, and the shape and size of the nozzle.

The hydrophilic substrate may comprise any support suitable for
15 printing plates. Typical supports include metallic and polymeric supports e.g. sheets or foils. Alternatively, the support may be a paper-based support. The surface of the support may be treated or coated to provide the necessary interaction with the polymer. Examples of surface coatings include a metallic oxide and gelatin coatings.

20 One suitable class of substrate comprises a support having one or more layers on its surface wherein at least one of the layers is hydrophilic and comprises a crosslinked cationic polymer. Preferably, the hydrophilic layer is the outermost layer.

The cationic polymer may comprise amino groups selected from
25 primary, secondary, tertiary and quaternary amino groups.

Preferred cationic polymers may be selected from the group consisting of polyalkylenepolyamines and alkylated derivatives thereof, products of addition of alkylcarboxylic acids and polyalkylenepolyamines, products of addition of ketones and polyalkylenepolyamines, products of addition of
30 aldehydes and polyalkylenepolyamines, products of addition of isocyanates and polyalkylenepolyamines, products of addition of isothiocyanates and polyalkylenepolyamines, products of addition of alkylene oxides and

polyalkylenepolyamines and products of addition of polyalkylene oxide block copolymers and polyalkylenepolyamines.

A particularly preferred cationic polymer is polyethyleneimine.

5 The cationic polymer may be present in the hydrophilic layer in an amount from 0.01 to 10 g/m², preferably from 0.05 to 1.0 g/m².

The layer comprising the cationic polymer may further comprise inorganic particulate material. Examples of suitable inorganic particulate material include particulate silica, alumina, titanium dioxide and kaolin.

10 The inorganic particulate material may be present in an amount from 0.1 to 30 g/m², preferably from 0.5 to 10 g/m².

Such substrates are described in our copending simultaneously filed GB patent application entitled "Method and Substrate for the Preparation of a Printing Plate", (Docket 84218).

15 Another suitable class of substrate comprises a metallic support. Preferably, the metallic surface is oxidized.

In a particularly preferred embodiment of the invention, a support having an anodized aluminium surface is employed.

20 Such a support is typically formed of aluminium which has been grained, for example by electrochemical graining, and then anodized, for example, by means of anodizing techniques employing sulfuric acid and/or phosphoric acid. Methods of both graining and anodizing are very well known in the art and need not be further described herein.

The following examples are provided to illustrate the invention. In the examples, all percentages are by weight unless otherwise specified.

EXAMPLES

Example 1

Yellow Pigment Dispersion:

The yellow pigment used in the writing fluid of the present invention was prepared as follows. A mixture was prepared containing the following components: 8000 g of polymeric beads, mean diameter of 50 μ m (milling media); 1600 g of Pigment Yellow 155 (Clariant Corp.); 400 g of oleoyl methyl taurine, (OMT), potassium salt and 4880 g of deionized water.

The above components were milled in a 40 liter double walled vessel obtained from BYK-Gardner using a high energy media mill manufactured by Morehouse-Cowles Hochmeyer. The mill was run for approximately 8 hours at room temperature. The dispersion was separated from the milling media by filtering the mill grind through a 4-8 μ m KIMAX® Buchner Funnel obtained from VWR Scientific Products. An additional 8000 g of dilution water was added to the filtered dispersion followed by a biocide, PROXEL™ GXL (Zeneca Corp.). The pigment is about 9.91% by weight of the total final dispersion and the biocide is about 230ppm by weight of the total final dispersion. The median pigment particle sizes is about 38 nm as measured by MICROTRAC II Ultrafine particle analyzer (UPA) manufactured by Leeds & Northrup.

Writing fluids were prepared by mixing together various quantities of a solution of the sulphonated polyester AQ55S (supplied by Eastman Chemical Corporation), as a 10.5% w/w solution in water, the yellow pigment dispersion, and the humectants triethylene glycol and glycerol, as shown in the Table.

Each solution was applied using a small squirrel-hair paintbrush to a separate part of a grained, anodised aluminium plate, so as to form a mark or pattern, and allowed to dry. When the test pattern had dried, the resulting printing plate was mounted on the plate cylinder of a Heidelberg T-Offset printing press, the press rollers were inked up using fount solution (Varn International™ Universal Pink Fount Solution, diluted 1 + 15 with water) and K&E® Novaquick 123W oil-based black ink, and printing started. Clean prints were obtained from the first impression, and the press run was continued until 6200 prints or impressions had been made. The number of impressions at which the test mark

began to fade was noted and is recorded in the following Table.

Solution number	1	2	3	4	5
Component	cm ³ added	cm ³ added	cm ³ added	cm ³ added	cm ³ added
AQ55S sol'n(10.5%)	1	1	1	1	1
pigment dispersion	0	0	2.5	2.5	2.5
triethylene glycol	0	1.5	0	1.5	1.5
glycerol	0	0.9	0	0	0.9
water	9	6.6	6.5	5	4.1
Number of impressions	2200	1200	>6200	>6200	>6200

- It was observed that the writing fluid compositions prepared according to the invention and containing the yellow pigment gave much better life on the press than the comparative compositions without pigment

Example 2

This example used the yellow pigment dispersion described in Example 1, and a cyan pigment dispersion.

10 Cyan Pigment Dispersion

- The cyan pigment dispersion was prepared similar to the yellow pigment dispersion described in Example 1 except that Pigment Blue 15:3 (Clariant Corp.) was used instead of Pigment Yellow 155. The amount of OMT potassium salt was 25 weight % based on the pigment. The pigment was about 15 9.97% by weight of the total final dispersion. The median pigment particle size was about 32 nm as measured by MICROTRAC II Ultrafine particle analyzer (UPA) manufactured by Leeds & Northrup.

Yellow Writing Fluid:

- To prepare the yellow writing fluid, 24.97 g of yellow pigment dispersion described in Example 1 (9.91% active), 0.2 g SURFYNOL® 465 (Air Products Inc.), 8.40 g glycerol, 14.5 g triethylene glycol and 3.00 g di(propyleneglycol) methyl ether (DOWANOL® DPM), and 9.52 g of AQ55® (10.5% active) were added together with distilled water so that the final weight of the ink was 100.0 g. The final ink contained 2.48% Pigment Yellow 155, 0.50% 25 SURFYNOL® 465, 8.40% glycerol, 14.5% triethylene glycol, 3%

di(propyleneglycol) methyl ether and 1% AQ55®. The solution was filtered through a 3 µm polytetrafluoroethylene filter.

Cyan Writing Fluid:

To prepare the cyan writing fluid, 16.55 g of yellow pigment dispersion described in Example 1 (9.97% active), 0.2 g SURFYNOL® 465 (Air Products Inc.), 6.50 g glycerol, 18.7 g triethylene glycol and 3.50 g di(propyleneglycol) methyl ether (DOWANOL® DPM), and 9.52 g of AQ55® (10.5% active) were added together with distilled water so that the final weight of the ink was 100.0 g. The final ink contained 1.65% Pigment Blue 15:3, 0.50% SURFYNOL® 465, 6.50% glycerol, 18.70% triethylene glycol, 3.50% di(propyleneglycol) methyl ether and 1.0% AQ55®. The solution was filtered through a 3 µm polytetrafluoroethylene filter.

The black cartridge of a Lexmark Z43 inkjet printer was emptied, the plastic foam removed, and residual ink washed out. It was refilled in turn with each of the above writing fluids, with a wad of cotton wool in place of the foam. The cartridge was replaced in the printer, and a test pattern was printed onto a sheet of hydrophilic substrate which comprised polyethylene terephthalate photographic film base coated from aqueous solution with the following coverages of the stated substances:

Cationic colloidal silica LUDOX CL ®	4.0 g/m ²
Polyethyleneimine (used as a 5% w/w solution and adjusted to pH 6.5 with sulphuric acid)	0.4 g/m ²
bis(vinylsulphonyl)methane (hardener)	0.024 g/m ²

The resulting imaged printing plates were mounted on a printing press and printed as described in Example 1. Good sharp prints having excellent resolution were obtained for plates made with each of the writing fluids, and 4500 impressions were run without any loss or fading of the test pattern.

CLAIMS

1. A method for the preparation of a printing plate comprising ink-jet printing an oleophilic image on a surface of a support by applying to the support an aqueous solution or aqueous colloidal dispersion of a polymer having water-solubilising groups wherein the water-solubilising groups interact with the surface of the support thereby binding the polymer to the support and rendering the polymer insoluble, characterised in that the aqueous solution or aqueous colloidal dispersion of polymer comprises pigment particles dispersed therein.
2. A method according to claim 1 wherein the water-solubilising groups are ionisable acid groups.
3. A method according to claim 1 or claim 2 wherein the water-solubilising groups are selected from the group consisting of carboxylic and sulphonic acid groups.
4. A method according to any one of the preceding claims wherein the polymer is selected from polyesters and polymers prepared by the polymerisation of ethylenically unsaturated monomers.
5. A method according to claim 1 wherein the polymer is a sulphonated polyester.
6. A method according to any one of the preceding claims wherein the polymer is present in the aqueous solution or aqueous colloidal dispersion in the range 0.02 to 8 % by weight
7. A method according to any one of the preceding claims wherein the particle size of the pigment is in the range 10 to 100 nm.
8. A method according to any one of the preceding claims wherein the pigment is selected from azo pigments, monoazo pigments, disazo pigments, azo pigment lakes, β -Naphthol pigments, Naphthol AS pigments, benzimidazolone pigments, disazo condensation pigments, metal complex pigments, isoindolinone and isoindoline pigments, polycyclic pigments, phthalocyanine pigments, quinacridone pigments, perylene and perinone pigments, thioindigo pigments, anthrapyrimidone pigments, flavanthrone pigments, anthanthrone pigments, dioxazine pigments, triarylcarbonium

pigments, quinophthalone pigments, diketopyrrolo pyrrole pigments, titanium oxide, iron oxide, and carbon black.

9. A method according to any one of the preceding claims wherein the pigment is selected from C.I. Pigment Blue 15:3, C.I. Pigment Red 122, C.I. Pigment Yellow 155, C.I. Pigment Yellow 74, C.I. Pigment Black 7 and bis(phthalocyanylalumino)tetraphenyl-disiloxane.

10. A method according to any one of the preceding claims wherein the pigment is present in an amount from 0.1 to 10% by weight based on the weight of the aqueous solution or aqueous colloidal dispersion of polymer.

11. A method according to any one of the preceding claims wherein the support is selected from metallic, paper-based and polymeric supports wherein the surface of the support is treated or coated to provide the necessary interaction with the polymer.

12. A method according to claim 11 wherein the support is coated with a hydrophilic layer of a crosslinked cationic polymer.

13. A method according to claim 11 wherein the support is metallic and has an oxidised surface.

14. A composition suitable for the preparation of a printing plate by inkjet printing comprising an aqueous solution or aqueous colloidal dispersion of a polymer having water-solubilising groups, characterised in that said aqueous solution or aqueous colloidal dispersion further comprises pigment particles dispersed therein.

15. A composition according to claim 14 wherein the water-solubilising groups are ionisable acid groups.

16. A composition according to claim 14 or claim 15 wherein the water-solubilising groups are selected from the group consisting of carboxylic and sulphonic acid groups.

17. A composition according to any one of claims 14 to 16 wherein the polymer is selected from polyesters and polymers prepared by the polymerisation of ethylenically unsaturated monomers.

18. A composition according to claim 14 wherein the polymer is a sulphonated polyester.

19. A composition according to any one of claims 14 to 18 wherein the polymer is present in the aqueous solution or aqueous colloidal dispersion in the range 0.02 to 8 % by weight

20. A composition according to any one of claims 14 to 19 wherein the particle size of the pigment is in the range 10 to 100 nm.

21. A composition according to any one of claims 14 to 19 wherein the pigment is selected from azo pigments, monoazo pigments, disazo pigments, azo pigment lakes, β -Naphthol pigments, Naphthol AS pigments, benzimidazolone pigments, disazo condensation pigments, metal complex pigments, isoindolinone and isoindoline pigments, polycyclic pigments, phthalocyanine pigments, quinacridone pigments, perylene and perinone pigments, thioindigo pigments, anthrapyrimidone pigments, flavanthrone pigments, anthanthrone pigments, dioxazine pigments, triarylcarbonium pigments, quinophthalone pigments, diketopyrrolo pyrrole pigments, titanium oxide, iron oxide, and carbon black.

22. A composition according to any one of claims 14 to 19 wherein the pigment is selected from C.I. Pigment Blue 15:3, C.I. Pigment Red 122, C.I. Pigment Yellow 155, C.I. Pigment Yellow 74, C.I. Pigment Black 7 and bis(phthalocyanylalumino)tetraphenyl-disiloxane.

23. A composition according to any one of claims 14 to 22 wherein the pigment is present in an amount from 0.1 to 10% by weight based on the weight of the aqueous solution or aqueous colloidal dispersion of polymer.

24. A printing plate obtainable by as method according to any one of claims 1 to 13.

METHOD AND COMPOSITION FOR THE PREPARATION OF A PRINTING PLATE

5

ABSTRACT

A method of preparing a printing plate comprises ink-jet printing
an oleophilic image on a surface of a support by applying to the support an
aqueous solution or aqueous colloidal dispersion of a polymer having water-
10 solubilising groups wherein the water-solubilising groups interact with the surface
of the support thereby binding the polymer to the support and rendering the
polymer insoluble, wherein the aqueous solution or aqueous colloidal dispersion
of polymer comprises pigment particles dispersed therein.
